

## Corse Dynamics Linear Shock Link

Recommended base settings for 180 lbs. rider:

Ohlins rear shock (except 2004 Ducati 749R) or OEM showa:  
100 n/mm rear spring with 15mm of preload

Ride height rod length 240mm eye to eye

This geometry is a base line developed with our R&D experience alter spring rate at approx. 25 lbs intervals as the rider goes beyond 180 lbs, changes will be in 5nm spring increments.

If steering feels sluggish increase ride height until a comfortable balance is achieved between turn in and stability.

Be sure whenever you change ride height to ensure clearance of all suspension components as exhaust and frame clearance can be very close.
